I. Background

Optumas has run both fee-for-service (FFS) claims and managed care encounters, with incurred dates from SFY18 - SFY23, through the Care Improvement Opportunity Tool (CIOT), an industry-standard episode of care grouper developed by Optumas in collaboration with Signify Health. CIOT uses detailed clinical algorithms to group claims and encounter data into episodes of care and compares the services provided, outcomes, and associated costs against clinically determined best practices to identify any inefficiencies in the form of Adverse Actionable Events (AAE).

The results from the CIOT can be used in actuarial, clinical, contractual, and operational settings. Optumas has been working with HCPF to analyze AAE rates and the distribution thereof among the 43 different episodes for various programs and provider groups within Colorado Medicaid. The CIOT groups claims and encounters into episodes of care based on clinical definitions of look-back and look-forward time periods centered around typical trigger claims and services for each type of episode.

II. What are Episodes?

Episodes include all clinically related services for a discrete condition/ procedure for the entire continuum of care - management, surgery, ancillary, labs, Rx, etc., - for a given time frame.

- Each service within an episode is considered either **Typical** or **Potentially Actionable**
- Episodes have been defined and refined with volunteer clinical experts assembled in Clinical Working Groups
- Fully consistent with [NQF recommendations on “groupers”](#)
- Some episodes have been influenced more by provider participant input because of ongoing implementations in other states
 - ✓ Maternity
 - ✓ Orthopedic procedures
 - ✓ Behavioral Health episodes
- Each episode can be assigned to an attending provider (found on the episode’s trigger event claim), such as the surgeon in the hospital

- Each episode can have multiple rendering providers who provided secondary/ downstream care
- An individual member can have multiple episodes simultaneously, but there can only be one member involved in each episode

III. Overview of Episode Parameters and Components

Relevant Procedure (Px) Codes - CPT, HCPCS, ICD procedure codes

Relevant Diagnosis (Dx) Codes - Only looks at primary Dx on hospital claims; on non-hospital claims, can look at Dx codes in any position, depending on the situation.

1. **Actionable adverse event (AAE)** - Potentially avoidable complications for the episode
 - a. Directly due to the condition/treatment, such as wound infection after surgery
 - b. Patient safety issues such as drug-drug interactions, deep vein thrombosis
2. **Typical** - signs and symptoms such as chest pain, shortness of breath

Relevant Pharmacy (Rx) Codes - Retail pharmacy considered typical service. Pharmaceutical drugs administered in a hospital setting will be considered typical or AAE depending on the overall consideration for that hospital admission.

Episode Type - Chronic, Other (maternity), or Procedural; **hospitals are currently measured only on Procedural episodes.**

Trigger Codes - Procedure and/or diagnosis codes that clearly identify the presence of a condition, treatment, illness, or injury (ICD proc/CPT code).

- Never require multiple diagnosis codes to trigger
- Sufficient procedure codes do not need to be accompanied by diagnosis code

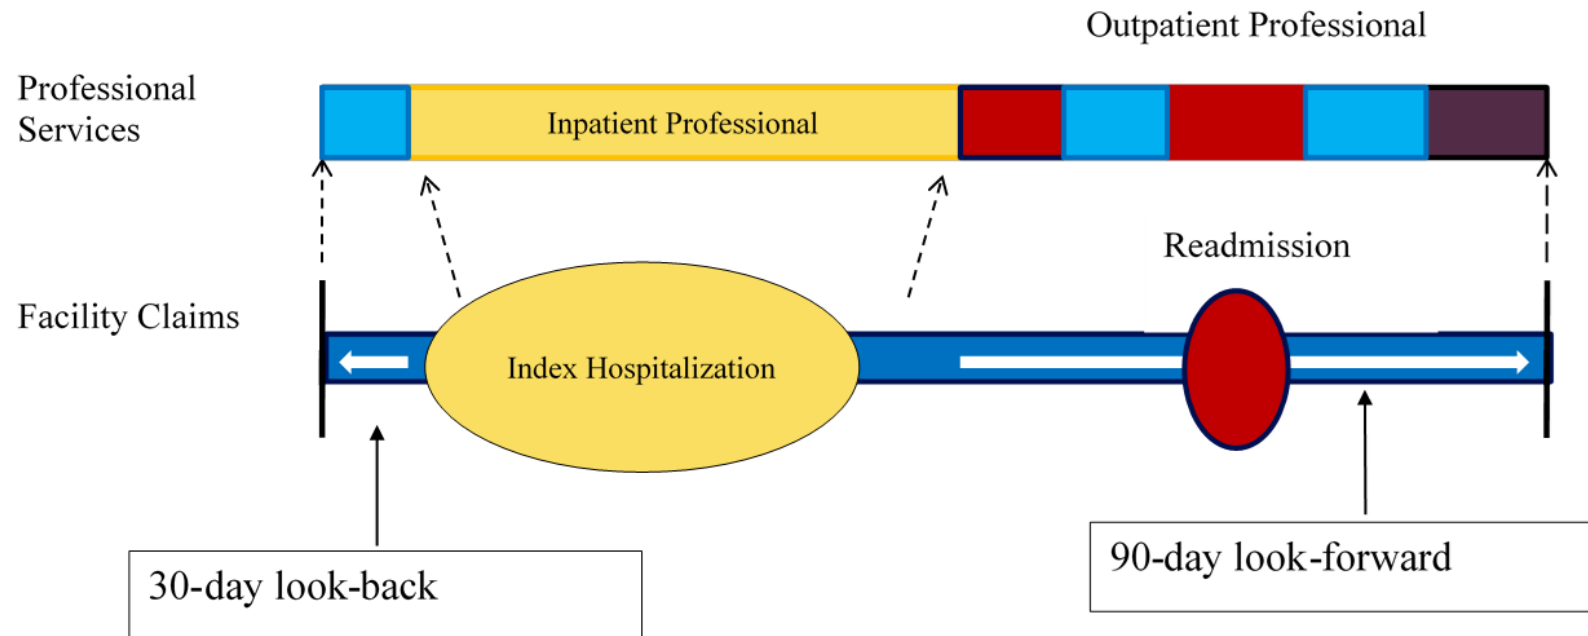

Confirmation Claim - **The following only applies for chronic episodes-** Pharmacy or Evaluation & Management claim (E&M) claim with a relevant diagnosis code → required because providers sometimes utilize temporary diagnosis codes on claims while they are ruling out potential diagnoses → do not want to consider the process of ruling out diagnosis same as trigger event for episode.

Episode Window - Defines the start and end of an episode.

Adverse Actionable Events (AAEs) - Based on **Service Assignments of Typical, Typical with AAE, or AAE.**

- Negatively affect patients and (potentially) avoidable (errors, readmissions, etc.)

IV. Assembling Components for Inpatient Procedural Episode

Key:

Claims for Adverse Actionable Events

Claims for typical care and services

Irrelevant

V. Episode Triggers

Episodes are identified through the presence of a trigger. Episode triggers are a combination of procedure and diagnosis codes. The specific conditions that define episode triggers can vary by episode type. General trigger parameters are described below, but please refer to the specific episode definition for the parameters that apply to any given episode. Links to the episode definitions can be found in [Section VII](#).

B. Procedural Episode Triggers

Three ways to trigger a procedural episode:

1. **Inpatient (IP) Stay** - Trigger procedure code in the principal position AND qualifying diagnosis code in the principal position
2. **Outpatient (OP) Facility** - Trigger procedure code in any position AND qualifying diagnosis code in any position on the same claim
3. **Professional** - Trigger procedure code in any position AND qualifying diagnosis code in any position on the same claim

Episode window for **procedural** episodes:

- Look-back period: 30 days prior to trigger date
- Look-forward period: 90 days post discharge (if IP stay) or 90 days postdate of procedure if non-inpatient. Deliveries are 60 days post discharge
- Some procedures have modified look-back or look-forward periods (e.g., colonoscopies)

C. Vaginal Delivery Episode Triggers

Three ways to trigger a **vaginal delivery** episode:

1. **Inpatient Stay** - Trigger procedure code in any position
2. **Outpatient Facility** - Trigger procedure code in any position
3. **Professional** - Trigger procedure code in any position

Episode window for **procedural** episodes:

- Look-back period: 3 days prior to trigger date
- Look-forward period: 60 days post-operative care time window

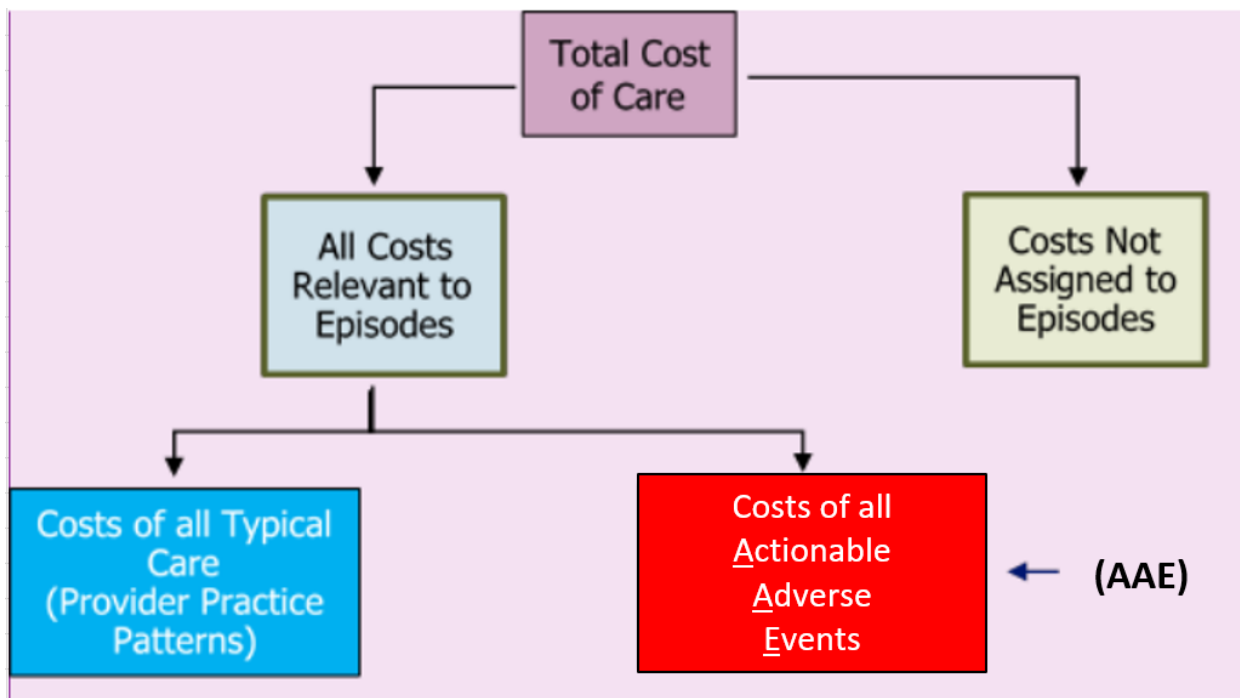

VI. Procedural Episode Definitions and Descriptions

The procedural episode definitions can be downloaded via the [HTP website](#)

Exhibit B in the Appendix includes parameters for procedural episodes

VII. What are AAEs?

- Adverse Actionable Events (AAEs) offer a powerful and detailed feedback loop to engage in process improvement through comparisons and root cause analysis
- An AAE is any event that negatively affects the patient and is potentially controllable by the health care delivery system - not just the individual provider or hospital
- AAEs may or may not be completely avoidable - goal is not to eliminate them but to reduce them as much as possible

VIII. AAE Determination and Measurement

A. Relevant Service Identification

Once an episode is triggered, clinically relevant services are identified.

All relevant services within the timeframe of an episode are included within an episode. These include office visits, emergency room visits, inpatient professional or facility services, labs, radiology or ancillary services. Relevant diagnosis and procedure codes help identify which services are included. Some procedure codes are sufficient to stand alone, while others require typical or AAE diagnosis codes on the same claim/claim line to steer services into the episode.

Relevant services can be assigned to one of three categories based on the presence or lack of complication codes:

1. **Typical (T)** - Includes evidence-informed services related to care for the episode.
e.g., anesthesia, implant, physical therapy for joint replacements

Typical care is identified through the presence of a typical care diagnosis code (see episode definitions) and the presence of a relevant procedure code on the same claim/claim line.

2. **Typical with AAE (T-AAE)** - Services that contain an AAE diagnosis code but would have occurred anyway without the presence of the complication.

Dollars not included in AAE costs, but services count as AAEs for AAE counts
e.g., DVT, infection for joint replacements

3. **Adverse Actionable Event (AAE)** - Any event that negatively affects the patient and is potentially controllable by the health care delivery system (as identified by complication diagnosis codes and timing)

AAE Costs **capture all costs of AAEs** occurring during the episode for which payments can be fully differentiated from those for typical services.

B. Identification of AAEs

AAEs are identified from the claims assigned to an episode in one of two ways:

- The ICD-10 diagnosis codes in combination with relevant procedure codes

- Type of claim (e.g., readmission or admission in chronic episodes)

1. Inpatient and Outpatient Procedures

- AAEs during the procedure (or during the stay for inpatient procedures)
- Readmissions
- Other AAEs in the post-discharge period

2. Identification of Readmissions as AAE

- Readmissions are AAEs and are specific to the episode, identified from diagnosis codes relevant to the episode
- More specific than common “all-cause” measure in use by Medicare and others

All costs related to the readmission are categorized as AAE (includes Rx during readmission)

C. Split vs. Unsplit AAE Costs

The same claims are often assigned to multiple episodes. Since the dashboard contains claim-level data for all procedural episodes, a given claim will appear more than once in the detail underlying the dashboard.

3. Split Dollars

Total dollars on a given claim are divided by the number of times a claim is used in the model within procedural episodes. When dollars exist in both a procedural episode(s) and a chronic episode, the dollars are fully attributed to the procedural episode(s) and then split across procedural episodes.

- **Strength:** Allows user to sum dollars across all episodes and get back to the original cost when looking at all episodes, at the same clinical association level since dollars are not duplicated; however, it is fundamentally difficult to tie back to other reports of expenditures because the tool does not process and group 100 percent of the claims into episodes in the first place. All data

underlying the dashboard already constitutes less than half of what was originally fed into the tool

- **Weakness:** As you start to limit the number of episodes being evaluated, the split dollars will understate the total costs because you are likely dropping some of the occurrences within episodes necessary to get back to the true total

4. Unsplit Dollars

- **Strength:** Accurately shows costs when looking at a single episode
- **Weakness:** As you include more episodes in your view, the level of duplication will increase and the sum of unsplit dollars will **overstate the true total costs**

As a general rule, when analyzing a single episode in isolation, using unsplit costs is preferable; however, when looking in aggregate across multiple episodes, using the split costs is preferable.

IX. Technical Reporting Adjustments

A. Annualization and Measurement Periods

- The CIOT requires at least two years of incurred claims data to be run through the tool to produce reliable results
- Data runs consisting of a **single year of claims/encounters do not produce reliable results** from which HCPF would be able to make accurate quality incentive payments. This is because the tool **does not have sufficient data to construct complete episodes** due to the look back and look forward period required to complete the episode
- The best short-term approach is to split results into individual years based on the service dates of the underlying incurred claims for each episode, producing separate datapoints for each year. Claims that make up the episode would be grouped according to their incurred dates. An episode is then evaluated to determine the calendar year in which the majority of claims costs associated with the episode were incurred. Associated costs for the entire episode are then attributed to that calendar year within the index score modeling. This approach ensures that episodes are complete and all associated claims experience underly the index score calculation, even if the incurred period spans multiple calendar years. For example, if an episode cost \$30,000 in total and had claims with service dates in both CY2020 and CY2021, and the costs were \$14,000 in CY2020 and \$16,000 in CY2021, the episode would be attributed to CY2021 within the index score calculation.
- ✓ It is important to note that there is significant drop in episode volume within both the left and right tails of the time period submitted through the tool, due to the look-back and look-forward time periods centered around typical trigger claims and services as defined for the episode the tool identifies. This is why the index score is calculated on a calendar year basis

B. Index Score Development and Statistical Significance

1. Peer Groups

Hospitals are categorized into four (4) peer groups based on current bed size. This is an effort to recognize that hospitals of different sizes may be predisposed to certain episodes, i.e., larger hospitals may have more specialized services than smaller hospitals, and to align the weights and index

score calculation as such. The peer groups are: Bed Count: <26, Bed Count: 26 - 99, Bed Count: 100 - 299, Bed Count: > 299.

Index Scores should only be compared between hospitals that are in the same peer group.

2. Index Score

The Index Score is calculated for each individual hospital using the following steps. Each step will be described in more detail below the summary.

Summary of Index Score Calculation Steps

1. Calculate peer group-specific Episode Weights and Baseline Raw Scores (these anchor weights were developed using SFY16-SFY21 experience)
2. Calculate hospital-specific AAE %
3. Calculate Hospital Index Score
4. Calculate Index Score Outliers
5. Repeat Steps 2-4 in iteration until no Index Score Outliers remain

Summary of Index Score Credibility Analysis Steps

Index Score Credibility Analysis requires an intermediate level of statistical knowledge.

6. Run bootstrapping statistical sampling for increasing number of Iteration Scenarios: 10, 50, 100, 200, 300, 400, 500
7. Calculate Sample Hospital Index Scores
8. Calculate key statistics from Sample Hospital Index Scores
9. Use Full Credibility Formula to determine credibility of Mean Index Score for each Iteration Scenario
10. Calculate Confidence Interval around Mean Index Score for credible Iteration Scenarios based on result from Step 9
11. Determine final list of hospitals that have a credible Hospital Index Score from Step 5

The examples provided for Index Score Calculation and Index Score Credibility are rounded for the purposes of this document. Reproduction of the same examples may yield slightly different results due to rounding.

3. Walkthrough of Index Score Calculation

Index Scores should only be compared between hospitals that are in the same peer group.

Step 1: Calculate peer-group specific Episode Weights and Baseline Raw Scores

The following calculations are specific to each procedural episode and are across all hospitals within a peer group:

- a. Calculate Total Episode Paid Dollars
- b. Calculate Total Episode AAE Dollars
- c. Calculate Episode AAE % = Total Episode AAE Dollars divided by Total Episode Paid Dollars
- d. Calculate Simple Average Total Paid Dollars = simple average of Total Episode Paid Dollars across procedural episodes within a peer group
- e. Calculate Simple Average AAE % = simple average of Episode AAE % across procedural episodes within a peer group
- f. Calculate Episode Total Paid Dollar Relativity = Total Episode Paid Dollars divided by Simple Average Total Paid Dollars
- g. Calculate Episode AAE % Relativity = Episode AAE % divided by Simple Average AAE %
- h. Calculate Peer Group Episode Weight = Episode Total Paid Dollar Relativity multiplied by Episode AAE % Relativity
- i. Calculate Peer Group Baseline Raw Score = Episode AAE % multiplied by Weight

Example Calculation for Episode Weights and Baseline Raw Scores is for illustrative purposes only.

Episode Category	Total Episode Paid Dollars (1a)	Total Episode AAE Dollars (1b)	AAE % (1c)=(1b)/(1a)	Simple Average Total Paid Dollars (1d)	Simple Average AAE % (1e)
Tonsillectomy	\$950,000	\$400,000	42.1%	\$2,464,286	18.0%
Coronary Angioplasty	\$650,000	\$350,000	53.8%	\$2,464,286	18.0%
Vaginal Delivery	\$4,000,000	\$450,000	11.3%	\$2,464,286	18.0%
Gall Bladder Surgery	\$3,000,000	\$200,000	6.7%	\$2,464,286	18.0%
Upper GI Endoscopy	\$1,650,000	\$100,000	6.1%	\$2,464,286	18.0%
Hysterectomy	\$2,650,000	\$100,000	3.8%	\$2,464,286	18.0%
Knee Arthroscopy	\$4,350,000	\$100,000	2.3%	\$2,464,286	18.0%

Episode Category	Episode Total Paid Dollar Relativity (1f)=(1a)/(1d)	Episode AAE % Relativity (1g)=(1c)/(1e)	Peer Group Episode Weight (1h)=(1f)*(1g)	Peer Group Baseline Raw Score (1i)=(1h)*(1c)
Tonsillectomy	0.39	2.34	0.90	0.38
Coronary Angioplasty	0.26	2.99	0.79	0.42
Vaginal Delivery	1.62	0.62	1.01	0.11
Gall Bladder Surgery	1.22	0.37	0.45	0.03
Upper GI Endoscopy	0.67	0.34	0.23	0.01
Hysterectomy	1.08	0.21	0.23	0.01
Knee Arthroscopy	1.77	0.13	0.23	0.01

Step 2 Calculate hospital-specific AAE %

The following calculations are specific to each procedural episode for each individual hospital:

- Calculate Hospital Episode Paid Dollars
- Calculate Hospital Episode AAE Dollars
- Calculate Hospital Episode AAE % = Hospital Episode AAE Dollars divided by Hospital Episode Paid Dollars

Example Calculation for Hospital Episode AAE % is for illustrative purposes only.

Episode Category	Hospital Episode Paid Dollars (2a)	Hospital Episode AAE Dollars (2b)	Hospital Episode AAE % (2c)=(2b)/(2a)
Tonsillectomy	\$380,000	\$80,000	21.1%
Coronary Angioplasty	\$195,000	\$140,000	71.8%
Vaginal Delivery	\$1,600,000	\$225,000	14.1%
Gall Bladder Surgery	\$600,000	\$40,000	6.7%
Upper GI Endoscopy	\$660,000	\$40,000	6.1%
Hysterectomy	\$0	\$0	N/A
Knee Arthroscopy	\$1,740,000	\$50,000	2.9%

Step 3 Calculate Hospital Index Score

The following calculations are specific to each individual hospital:

- a. Calculate Episode Raw Score = Peer Group Episode Weight multiplied by Hospital Episode AAE %
- b. Calculate Hospital Total Baseline = sum of all Peer Group Baseline Raw Scores for procedural episodes where hospital had historic experience
- c. Calculate Episode Index Score = Episode Raw Score divided by Hospital Total Baseline multiplied by 100

Episode Category	Peer Group Episode Weight (1h)	Hospital Episode AAE % (2c)	Episode Raw Score (3a)=(1h)*(2c)	Hospital Total Baseline (3b)=Sum (1i) ¹	Episode Index Score (3c)=(3a)/(3b)*(100)
Tonsillectomy	0.90	21.1%	0.19	0.97	19.6
Coronary Angioplasty	0.79	71.8%	0.57	0.97	58.5
Vaginal Delivery	1.01	14.1%	0.14	0.97	14.7
Gall Bladder Surgery	0.45	6.7%	0.03	0.97	3.1
Upper GI Endoscopy	0.23	6.1%	0.01	0.97	1.4
Hysterectomy	0.23	N/A	N/A	N/A	N/A
Knee Arthroscopy	0.23	2.9%	0.01	0.97	0.7

Step 4: Calculate and remove Index Score Outliers

The following calculations are specific to each individual hospital:

- a. Summarize the number of individual episodes by episode type
- b. Calculate Index Score per Episode = Episode Index Score / Number of Episodes
- c. Remove the episode with the highest AAE % for an episode category that has an Index Score per Episode over the outlier threshold.
 - Only one episode for an episode category is removed at a time. This is an effort to remove a small number of episodes that generate a high portion of the Hospital Index Score.
 - Please note that not all hospitals will have episodes removed during this process.

Example Calculation of Index Score Outliers is for illustrative purposes only.

¹ Hospital Total Baseline shown in (3B) is the sum of all Peer Group baseline Scores from (1i) for episodes where the hospital had experience. In this example, the Peer Group Baseline Raw Score for Hysterectomy would not be included in the Hospital Total Baseline.

Episode Category	Number of Episodes (4a)	Episode Index Score (3c)	Index Score per Episode (4b)=(3c)/(4a)	Flag Outliers (4c)	New Number of Episodes (4d)
Tonsillectomy	200	19.62	0.10		200
Coronary Angioplasty	10	58.55	5.85	Y	9
Vaginal Delivery	300	14.74	0.05		300
Gall Bladder Surgery	100	3.11	0.03		100
Upper GI Endoscopy	300	1.41	0.00		300
Hysterectomy	0	N/A	N/A		N/A
Knee Arthroscopy	500	0.67	0.00		500

The outlier threshold was set to 5.0 in this example. This may vary from the final outlier threshold used for the Index Score calculation.

Step 5: Repeat Steps 1-4 in iteration until no Index Score Outliers remain

Steps 1-4 will be recalculated after the Index Score Outliers are removed from each hospital, where applicable. This will recalibrate the Hospital Episode AAE % used to calculate the Episode Index Score and Hospital Index Score Per Episode.

This process will repeat in iteration until no Index Score Outliers remain. Once that has been completed, the final Hospital Index Score is calculated as the sum of all Episode Index Scores. This is shown as (5A) at the end of the example calculation below.

The following tables represent the same examples from above in Steps 1-3, assuming the only Index Score Outliers are for the example hospital for Coronary Angioplasty.

Example re-calculation of steps 1-4 after removing Index score outliers - for illustrative purposes only.

Episode Category	Hospital Episode Paid Dollars (2a)	Hospital Episode AAE Dollars (2b)	Hospital Episode AAE % (2c)=(2b)/(2a)
Tonsillectomy	\$380,000	\$80,000	21.1%
Coronary Angioplasty	\$85,000	\$30,000	35.3%
Vaginal Delivery	\$1,600,000	\$225,000	14.1%
Gall Bladder Surgery	\$600,000	\$40,000	6.7%
Upper GI Endoscopy	\$660,000	\$40,000	6.1%
Hysterectomy	\$0	\$0	N/A
Knee Arthroscopy	\$1,740,000	\$50,000	2.9%

Note: Outliers are removed from Coronary Angioplasty episode based on example in Step 4 above.

Episode Category	Peer Group Episode Weight (1h)	Hospital Episode AAE % (2c)	Episode Raw Score (3a)=(1h)*(2c)	Hospital Total Baseline (3b)=Sum (1i) ²	Episode Index Score (3c)=(3a)/(3b)*100
Tonsillectomy	0.90	21.1%	0.19	0.97	19.62
Coronary Angioplasty	0.79	35.3%	0.28	0.97	28.78
Vaginal Delivery	1.01	14.1%	0.14	0.97	14.74
Gall Bladder Surgery	0.45	6.7%	0.03	0.97	3.11
Upper GI Endoscopy	0.23	6.1%	0.01	0.97	1.41
Hysterectomy	0.23	N/A	N/A	N/A	N/A
Knee Arthroscopy	0.23	2.9%	0.01	0.97	0.67

Episode Category	Number of Episodes (4a)	Episode Index Score (3c)	Index Score per Episode (4b)=(3c)/(4a)	Flag Outliers (4c)	New Number of Episodes (4d)
Tonsillectomy	200	19.62	0.10		200
Coronary Angioplasty	9	28.78	3.20		9
Vaginal Delivery	300	14.74	0.05		300
Gall Bladder Surgery	100	3.11	0.03		100
Upper GI Endoscopy	300	1.41	0.00		300
Hysterectomy	N/A	N/A	N/A		N/A
Knee Arthroscopy	500	0.67	0.00		500

² Hospital Total Baseline shown in (3B) is the sum of all Peer Group baseline Scores from (1i) for episodes where the hospital had experience. In this example, the Peer Group Baseline Raw Score for Hysterectomy would not be included in the Hospital Total Baseline.

Calculate Hospital Index Score = sum of Episode Index Score from (3C) after all outliers have been removed across all hospitals

Hospital Index Score (5a) = 68.33

4. Walkthrough of Index Score Credibility Analysis

Step 6: Run bootstrapping statistical sampling for increasing number of Iteration Scenarios: 10, 50, 100, 200, 300, 400, 500

The bootstrapping statistical sampling is a sampling technique that generates a random sample of data from the overall data set. In this case, it will generate a random sample of episodes for each hospital from all their episodes. A few key notes are provided below regarding the use of bootstrapping to determine the credibility of the Hospital Index Score from Step 5.

- The key advantage of using bootstrapping is that a Sample Hospital Index Score can be calculated for each sample, and the resulting Sample Hospital Index Scores from each sample can be used to calculate key statistics that will be used to determine the credibility of the Hospital Index Score calculated in Step 5
- The bootstrap sampling is done with replacement, meaning one episode is selected from the total, and then replaced, and then another episode is selected. This is performed for each hospital individually, such that each hospital sample will only contain their specific historic episode experience
- The Iteration Scenarios represent the number of individual bootstrapping samples that are generated. For example: Iteration Scenario “10” will generate 10 random bootstrapping samples for each hospital, Iteration Scenario “50” will generate 50 random bootstrapping samples for each hospital, etc.
- The resulting individual samples will not contain all episodes for each hospital, as this would result in the Sample Hospital Index Score being the same as the Hospital Index Score from Step 5 and not allow for statistical metrics to be calculated appropriately
- In general, the distribution of episodes within each individual sample will be similar to the overall distribution of episodes for each hospital

Step 7: Calculate Sample Hospital Index Scores

- A Sample Hospital Index Score is calculated using each individual bootstrapping sample for each individual hospital for all Iteration Scenarios
 - ✓ For example: Iteration Scenario “10” will generate 10 Sample Hospital Index Scores for each individual hospital based on their specific bootstrap samples, Iteration Scenario “50” will generate 50 Sample Hospital Index Scores for each individual hospital based on their specific bootstrap samples, etc.
- The same process outlined in Steps 1-4 will be used to calculate the Sample Hospital Index Scores.
 - ✓ The outlier calculation process will not be performed, as this has already been completed, and the final Peer Group Episode Weight and Peer Group Baseline Raw Score from the anchor weights will be used

Step 8: Calculate key statistics from Sample Hospital Index Scores

Calculate the following key statistics for each Iteration Scenario using the Sample Hospital Index Scores from Step 7:

- a. Mean Index Score
- b. Standard Deviation of Index Scores
- c. Standard Deviation of the Mean Index Score

Example Statistical Measure Calculations for Iteration Scenario “10” - for illustrative purposes only.

Sample No.	Sample Hospital Index Score
1	67.8
2	71.8
3	71.2
4	69.9
5	61.9
6	70.7
7	66.0
8	63.9
9	62.8

Sample No.	Sample Hospital Index Score
10	62.0

Statistical Measure	Statistic
8a. Mean Sample Hospital Index Score	66.79
8b. Standard Deviation of Sample Hospital Index Scores	3.98
8c. Standard Deviation of Mean Sample Hospital Index Score	1.26

Step 9: Use Full Credibility Formula to determine credibility of Mean Index Score for each Iteration Scenario

The following calculations are specific to each individual hospital.

- a. Select threshold for difference of sample mean to within a specified percentage of the true mean
 - This has been set at 5%
- b. Select confidence level
 - This has been set at 90%
- c. Calculate number of standard deviations for 90% Confidence Interval based on a normal distribution
 - 90% Confidence Interval Standard Deviations = 1.645
- d. Calculate number of samples needed for the Mean Sample Hospital Index Score to be credible using the Full Credibility Formula
 - Number of Samples = (Standard Deviation of Sample Hospital Index Scores / Mean Sample Hospital Index Score)² * (Standard Deviation for 90% Confidence Interval / Threshold for difference of sample mean)²

If the Number of Samples needed to be Fully Credible is less than or equal to the number of samples run for a specific Iteration Scenario, then the statistical measures for that Iteration Scenario are deemed credible. The following Steps 10 - 11 will only apply to Iteration Scenarios that have been determined to be fully credible.

Example Full Credibility Calculation for Iteration Scenario “10” is for illustrative purposes only.

Iteration Scenario	Mean Sample Hospital	Standard Deviation of	% Difference Threshold of Sample Mean	90% Confidence Interval	No. Samples to be Fully Credible
--------------------	----------------------	-----------------------	---------------------------------------	-------------------------	----------------------------------

	Index Score (8a)	Sample Hospital Index Scores (8b)	to the True Mean (9a)	Standard Deviations (9c)	$(9d) = (8b/8a)^2 * (9c/9a)^2$
10	66.79	3.98	5%	1.645	4

In this example, the number of samples needed to be fully credible is 3.84, which can be rounded up to next nearest whole number of 4. This is less than or equal to the number of samples in the Iteration Scenario, resulting in this Iteration Scenario being credible.

Step 10: Calculate Confidence Interval around Mean Index Score for credible Iteration Scenarios based on result from Step 9

The following calculations are specific to each individual hospital, and only apply to Iteration Scenarios that are deemed credible based on Step 9.

- a. Select confidence level
 - This has been set at the same 90% used for Step 9
- b. Calculate number of standard deviations for 90% Confidence Interval based on a normal distribution
 - 90% Confidence Interval Standard Deviations = 1.645
- c. Calculate Lower Bound of Confidence Interval
- d. Calculate Upper Bound of Confidence Interval

Iteration Scenario	Mean Sample Hospital Index Score (8a)	Standard Deviation of Mean Sample Hospital Index Score (8c)	90% Confidence Interval Standard Deviations (10b)	90% Confidence Interval: Lower Bound (10c) = (8b) - (8c) * (10b)	90% Confidence Interval: Upper Bound (10c) = (8a) + (8c) * (10b)
10	66.79	1.26	1.645	64.72	68.86

Step 11: Determine final list of hospitals that have a credible Hospital Index Score from Step 5

The following calculations are specific to each individual hospital, and only apply to Iteration Scenarios that are deemed credible based on Step 9.

- a. If the Hospital Index Score is within at least one credible confidence interval, the Hospital Index Score for that hospital is determined to be credible.

- b. If none of the Iterations Scenarios are deemed credible for a hospital, then the Hospital Index Score for that hospital is also determined to not be credible.

In the examples provided, the Hospital Index Score from Step 5 of 68.33 is within the 90% Confidence Interval of (64.72, 68.86) from Step 10, and is thus deemed a credible Hospital Index Score.

C. Risk Adjustment

Optumas and the Department have refined the risk adjustment methodology applied to the risk adjusted version of the hospital index score.

Risk factors were developed using the same set of procedural episodes used to develop the peer group weights that are applied within the index score calculation. These episodes are limited to only those that were attributed to a participating hospital within the six years of data (SFY16-SFY21) ran through the episode grouper. The following categories were reviewed to determine whether each had a significant impact on unsplit AAE costs as a percent of total episode unsplit costs for each type of procedural episode. Comments on whether the categories were ultimately included within the risk adjustment modeling are noted for each:

- **Category of Aid Factor:** no risk adjustment factor developed for differing populations (disabled/non-disabled, adults/children) as variations in AAE were not material when holding all other variables constant.
- **Gender Factor:** no risk adjustment factor developed for gender since the variations in AAE were not material holding other variables constant. Additionally, most procedural episodes apply to a single gender (e.g., Vaginal Delivery, C-Section, and Breast Biopsy).
- **Comorbidity Factor:** risk adjustment factor developed to account for members having multiple chronic conditions and comorbidities, excluding behavioral health conditions. Final factors developed based on number of conditions ranging from 0 to 4+.
- **Behavioral Health (BH) Factor:** risk adjustment factor developed to account for members having behavioral health conditions. Final factors

developed based on the presence of at least one behavioral health chronic episode.

Risk adjustment factors were developed by reviewing AAE costs as a percentage of the total episode cost for the various Comorbidity Factor (0 to 4+ conditions) and Behavioral Health Factor (0 or 1+ conditions) groupings for each type of procedural episode. The ratio of average AAE percent was calculated as the risk adjustment factors. The risk adjustment factors are shown in Appendix C.

Not all episodes are risk adjusted, due to either limited variation of AAE costs in these episodes, or lack of statistically different AAE costs. A risk factor of 1.00 indicates that no additional adjustment is applied for risk scores.

The risk adjustment factors are applied to the AAE costs for each episode attributed to the hospital and to each episode within the associated peer group. The final average risk score for each combination of hospital and procedural episode type is compared to their corresponding peer group average risk score, and the relative risk difference is applied as the risk adjustment impact to the hospital AAE. A hospital may see an increase or decrease to their AAE depending on how their relative risk profile compared to the peer group's risk profile. Additionally, there is now only one set of peer group weights and index score, as the peer group is held constant in both the risk adjusted and unadjusted scenarios. Examples of the risk adjustment application are shown for example episodes. The peer group risk score and hospital risk score are based on the average risk score for members that had that procedural episode, based on the number of comorbidities and behavioral health conditions.

Hospital Name	Episode Type	A	B	C = B / A
		Peer Group Risk Score	Hospital Risk Score	Hospital Risk Relativity
HOSPITAL	Colorectal Resection	1.44	1.30	0.90
HOSPITAL	Coronary Angioplasty	3.73	3.90	1.04
HOSPITAL	C-Section	1.53	1.50	0.98
HOSPITAL	Vaginal Delivery	1.43	1.50	1.05

Hospital Name	Episode Type	D	E	F = E / C	Hospital vs. Peer Group	
		Peer Group AAE	Hospital AAE	Hospital Risk Adj. AAE	Risk Profile	Unadjusted AAE
HOSPITAL	Colorectal Resection	9.4%	9.0%	10.0%	<i>Lower</i>	<i>Lower</i>
HOSPITAL	Coronary Angioplasty	7.2%	6.0%	5.7%	<i>Higher</i>	<i>Lower</i>
HOSPITAL	C-Section	2.9%	3.0%	3.1%	<i>Lower</i>	<i>Higher</i>
HOSPITAL	Vaginal Delivery	1.5%	2.0%	1.9%	<i>Higher</i>	<i>Higher</i>

Please note, the risk adjustment development and application was performed only for unsplit costs. As such, the risk adjustment application is not intended to be applied or reviewed at the split cost level.

D. Attribution to Facility and Attending Provider

Procedural episodes are generally centered around inpatient/outpatient (facility) services. Episodes with no inpatient/outpatient claims or with Provider ID discrepancies are not included within the hospital index score calculation.

For an episode to be attributed to a hospital, the episode must have one of the following:

- An inpatient trigger claim,
- An outpatient trigger claim, or
- A professional trigger claim whose incurred date of service corresponds to an inpatient/outpatient claim with a date span that captures the professional claim's service date.

For an episode to be attributed to a hospital there must be uniformity in the hospital identified by both the Provider ID and NPI populated on the claim under any of the methods outlined above. If the trigger claim was incurred at an ambulatory surgical center (POS = 24) or a birthing center (POS = 25), the episode is not attributed to a hospital and is removed from the subsequent index score calculation.

Inpatient/outpatient trigger claims rendered by applicable hospitals are attributed to the hospital where the trigger event occurred to the extent there are no provider ID discrepancies.

Professional triggers require additional review. The following results may occur when attempting to identify a corresponding facility claim associated with a professional trigger based on service date spans:

Results of service date mapping	Description of Provider IDs on Corresponding Facility Claims	Final Classification
No corresponding facility service found with a date span matching the professional trigger claim	N/A	Episode not attributed to a hospital since there are no corresponding facility triggers.
Single corresponding facility claim found with a date span matching the professional trigger claim	Only one hospital provider identified on the corresponding facility claim	Episode attributed to the hospital on corresponding facility claim
Multiple facility claims identified with a date span overlapping the professional trigger claim	Provider IDs vary across the corresponding facility claims or have missing provider information	Episode not attributed to any hospital since unable to determine responsible entity without additional detailed review
Multiple facility claims identified with a date span	Provider IDs are consistent across the	Episode attributed to the hospital on corresponding facility claims

overlapping the professional trigger claim	corresponding facility claims	
--	-------------------------------	--

Episodes that have a successful attribution based on trigger claim information are retained for use within the hospital index modeling. Any unattributed episodes are excluded from subsequent modeling.

Episodes that are attributed to a hospital then go through a secondary attribution process where the **attending provider**, typically the **surgeon**, is identified based on the **episode’s trigger claim** or corresponding professional claim if the trigger is a facility claim. The same criteria of uniform provider ID information applies when determining the attending provider attribution.

E. Substance Use Disorder (SUD) Scrubbing and Other Episode Exclusions

Unless the Department can obtain a legal opinion that SUD data can be shared with hospitals while complying with 42 CFR Part 2, the Department must scrub SUD data from the distributed dashboards, using the [BIDM’s definition of SUD](#).

Any episodes that have at least one claim with a SUD service have been excluded from the Hospital Index calculation. SUD ICD-10 diagnoses must be within in the primary code position to be determined as an excluded SUD claim for Hospital Index purposes. Other SUD services are identified as having any of either: DRG, procedure code, revenue code, place of service, or provider type based on the list provided in Exhibit C. Excluding the entire episode from the Hospital Index calculation once an SUD service is identified within the procedural episodes removes the potential for skewed results and understated episode information that may occur if the episode were retained with only the non-SUD claims.

Other procedural episodes in addition to those with SUD services are excluded from the Hospital Index calculation based on termination flags identified within the episode grouper. These include the following categories that are either clinical in nature or defined by the grouper:

- Active Cancer Diagnosis
 - Note, not all episodes for a member with active cancer are removed. For example, breast cancer is not filtered out for mastectomy.

- Age (member’s age outside of range specified as standard for the episode type by the grouper)
- Incomplete Episode
- Left Against Medical Advice
- Orphan Trigger
- Multiple Payers (claims where there are Medicare or third-party liability payments)
- End-Stage Renal Disease
- Hemophilia
- Organ Transplant
- Sickle Cell Disease
- High Cost Episode (99th percentile of total episode cost by procedural episode type)

Additionally, after the above exclusions are applied, a hospital must have four or more episodes within a specific episode type for those procedures to be included within the Hospital Index calculation. If for example, a specific hospital has only two Knee Arthroscopy episodes within the two-year study period, the Knee Arthroscopy episodes will be deemed low volume and excluded from the Hospital Index. Please see the table below for an example of the application of the low volume threshold used to exclude episodes from the model.

Low Volume Episodes Exclusion

Procedural Episode	Hospital	Episode Count	Low Volume Exclusion?	Included Episodes
Bariatric Surgery	A	12	N	12
Breast Biopsy	A	50	N	50
C-Section	A	4	N	4
CABG &/or Valve Procedures	A	3	Y	0
Cataract Surgery	A	22	N	22
Colonoscopy	A	3	Y	0
Knee Arthroscopy	A	5	N	5
Tonsillectomy	A	1	Y	0
Total Episodes	A	100		93

F. Incorporation into HTP

CIOT and the Hospital Index will be utilized within the group of measures focused on clinical and operational efficiencies in the Hospital Transformation Program (HTP).

G. Population for 2023 Dashboard

Medicaid members enrolled in the Accountable Care Collaborative (ACC) between 1/1/2021 and 12/31/2022.

a. Exclusions

The CIOT model excludes members dually enrolled in Medicare and Medicaid, as well as members enrolled in PACE. The model assigns FFS claims and managed care encounters to episodes of care, so any claim or encounter that did not group to an episode will not be present in the CIOT results. Members who did not receive any care between 1/1/2021 and 12/31/2022 will not be present in the CIOT results.

H. Eligibility Types

The eligibility groups on the dashboard are an aggregation of client program aid codes, as well as member age, gender, disability status, and third-party liability (TPL) status at the time of service.

X. Dashboard Updates and Distribution

A. How the Dashboards are Created

1. Optumas runs claims and encounter data through the CIOT model
2. Raw CIOT output is summarized at the episode level, along with a separate table identifying claims associated with episode. Additional output tables also identify if each individual claim was considered typical or AAE within each associated episode.
3. Optumas crosswalks episode information onto each associated claim number, along with typical or AAE designation. The result allows for claim-level identification of typical and AAE, along with all other claim-level information, so it is actionable to HCPF and providers.

4. Tableau dashboard created by the Department and hosted on Optumas' Tableau Server.

- ✓ The CIOT model groups claims into clinically defined episodes → any claim that doesn't meet criteria for an episode is dropped from the underlying dataset in step 1 above.

B. What the Dashboards Shouldn't be Used to Measure

- **Care management** → the data is too old to be actionable (the episodes have already been completed)

C. When the Dashboards will be Updated

Note: Index score weighting and risk adjustment methods were updated in FY24, and applied retroactively to the CY20-21 index scores.

Fiscal Year	FY21	FY22	FY23	FY24	FY25	FY26
Underlying Data as of 7/1	FY14-19	FY15-21	FY16-22	FY18-23	FY18-24	FY18-25
Index Score Data Points	1. CY15-16 2. CY16-17 3. CY17-18	1. CY15-16 2. CY16-17 3. CY17-18 4. CY18-19	1. CY16-17 2. CY17-18 3. CY18-19 4. CY19-20 5. CY20-21	1. CY16-17 2. CY17-18 3. CY18-19 4. CY19-20 5. CY20-21 6. CY21-22	1. CY16-17 2. CY17-18 3. CY18-19 4. CY19-20 5. CY20-21 6. CY21-22 7. CY22-23	1. CY16-17 2. CY17-18 3. CY18-19 4. CY19-20 5. CY20-21 6. CY21-22 7. CY22-23 8. CY23-24

XI. Guidance on Identifying Opportunities and Interpreting Hospital Index Dashboards

A. Start with biggest bang for our buck.

- Identify which episodes, categories of service, providers, etc. have the **highest AAE costs relative to the Peer Group**. Use the Peer Group Comparison and Hospital Detail dashboards to identify opportunities in these areas.

Episode Description (Risk Adj. Detail Deliverable)	Total Cost	AAE Cost	AAE %	Peer Group AAE %	Hospital Index Score Breakdown	Peer Group Index Score Breakdown	Episode Count
Bariatric Surgery	\$665,470	\$30,559	4.59%	4.85%	1.84	1.94	66
Breast Biopsy	\$207,920	\$26	0.01%	0.07%	0.00	0.00	132
C-Section	\$4,941,842	\$157,087	3.18%	2.91%	3.29	3.01	697
CABG &/or Valve Procedures	\$1,049,544	\$56,960	5.43%	5.49%	3.60	3.63	24
Cataract Surgery	\$154,215	\$2,385	1.55%	4.12%	0.11	0.30	59
Colonoscopy	\$788,101	\$7,887	1.00%	1.73%	0.07	0.12	656
Colorectal Resection	\$1,197,227	\$166,019	13.87%	12.43%	53.49	47.97	47
Coronary Angioplasty	\$1,334,918	\$142,514	10.68%	7.19%	17.31	11.66	82

- The overview of episodes that is pictured above is on the Hospital Detail dashboard and displays volume (based on size of the bubble), AAE %, and Avg Total Cost per Episode. Episodes in the upper-right quadrant are above average in Average Total Cost and in AAE %.

COS	Total Cost	AAE Cost	AAE %	Episode Count
Inpatient	\$2,704,313	\$366,433	13.5%	285
Professional	\$777,309	\$28,456	3.7%	300
Outpatient - ER	\$23,634	\$10,090	42.7%	55
Home Health	\$26,114	\$5,913	22.6%	28
Outpatient - Non...	\$220,835	\$5,412	2.5%	271
FQHC/RHC	\$34,380	\$4,977	14.5%	96
Lab/Rad	\$82,329	\$1,768	2.1%	299
DME	\$59,856	\$1,361	2.3%	173
Emergency Trans..	\$4,364	\$883	20.2%	14
Rx	\$333,679	\$0	0.0%	297

Elig Type	Total Cost	AAE Cost	AAE %	Episode Cou..
AwDC	\$2,676,088	\$231,885	8.7%	198
Disabled	\$1,083,138	\$160,610	14.8%	64
AFDC Parent	\$452,129	\$32,694	7.2%	35
Expansion Adult	\$102,315	\$103	0.1%	10
Other	\$673	\$0	0.0%	1

- When viewing AAE % it is important to look at **volume** in addition to costs. Reducing a high AAE % that only impacted one member or was worth only a few dollars is not likely to be as effective as lowering a high AAE % associated with lots of costs and/or members.
- The CIOT algorithms consider all **Rx costs as typical**, except those associated with inpatient or ED visits that were driven by chronic condition exacerbation. Please refer to other tools for Rx management in particular.

B. Make fair and meaningful comparisons.

- Variation in average episode cost is partially driven by **variation in reimbursement rates** across providers. Before drawing conclusions about efficiency of care due to differences in cost, use the tool to drill down and look at unit pricing.
- In addition to unit pricing considerations, you also need to **account for episode mix** when comparing average episode cost. For example, a provider might have a higher average episode treatment cost because they saw more members with expensive procedures like a hip replacement than other physicians who might have only seen members for tonsillectomies. The graph below shows the variation in treatment of only the Knee Replacement & Knee Revision episodes, which is more meaningful. The dashed reference lines represent the average across the peer group, and the solid reference lines represent the average within the selected hospital.

- The **Members dashboard** can be used to view and download the data at the member level across different variables such as age, race, county, etc. Member name, Medicaid ID, and DOB are provided to give users the ability to use the Hospital Index data in tandem with EHRs.

- The **Claims dashboard** is used to view and download data at the claim level. Use the filters above to narrow down the selection and to view individual episodes at a deeper level, with claims sorted chronologically. The 13-digit number embedded within the Claim ID fields will typically represent the ICN. The Claim ID field can be expanded by clicking “+” to view the procedure codes on the claim.

C. Identifying patterns.

- Are there particular conditions, diagnosis codes, DRGs, services, or providers where AAE costs are consistently high?

AAE Dx Code Desc	Total Cost	AAE Cost	AAE %	Episode Cou..
PERITONEAL ABSCESS	\$47,880	\$47,880	100.0%	63
SEPSIS, UNSPECIFIED ORGAN..	\$31,480	\$31,480	100.0%	82
PERFORATION OF INTESTINE ..	\$20,598	\$20,598	100.0%	36
ACUTE KIDNEY FAILURE, UNS..	\$13,893	\$13,893	100.0%	43
OTH POSTPROCEDURAL COM..	\$11,814	\$11,814	100.0%	33
PLEURAL EFFUSION, NOT ELS..	\$11,203	\$11,203	100.0%	16
HYPOKALEMIA	\$10,974	\$10,974	100.0%	47

- Does the same AAE or a **high AAE %** for a particular provider consistently occur at similar points in treatment? The below charts show a few selected providers that have higher concentrations of AAE in the post-procedure phase of the episode. Drill down deeper into the episode to view what is driving the AAE Cost by looking at diagnosis codes, services, and DRGs.

D. Additional Considerations

- Bear in mind that different provider types have **differing amounts of influence** over each episode type and/or description. The amount of each provider type's influence will **change over time**, as well as potentially vary by the sub-population.
- Consider **how long** it will likely take a proposed intervention to **impact performance** on an episode. Outcome/performance improvements that cannot be realized for several years (or decades) will not help the provider pass near-term Hospital Index metrics but should still be pursued to the extent feasible (i.e., in addition to the interventions that will produce near-term results).
- Consider the **resources** that will be required to address performance on a particular episode/implement a proposed intervention. Prioritize interventions that will achieve the biggest bang for your buck, that potentially require less capital (or staff) investments and/or will be simpler to implement.

XII. Appendix

A. Exhibit A - Procedural Episode Parameters

EPISODES	Acronym	Look-Back	Look-Forward	Age Range
Cataract Surgery	CTRTSU	30 days	90 days	18-65
Tonsillectomy	TONSIL	30 days	90 days	2-65
Lung Resection	LNGSRG	30 days	90 days	18-65
